

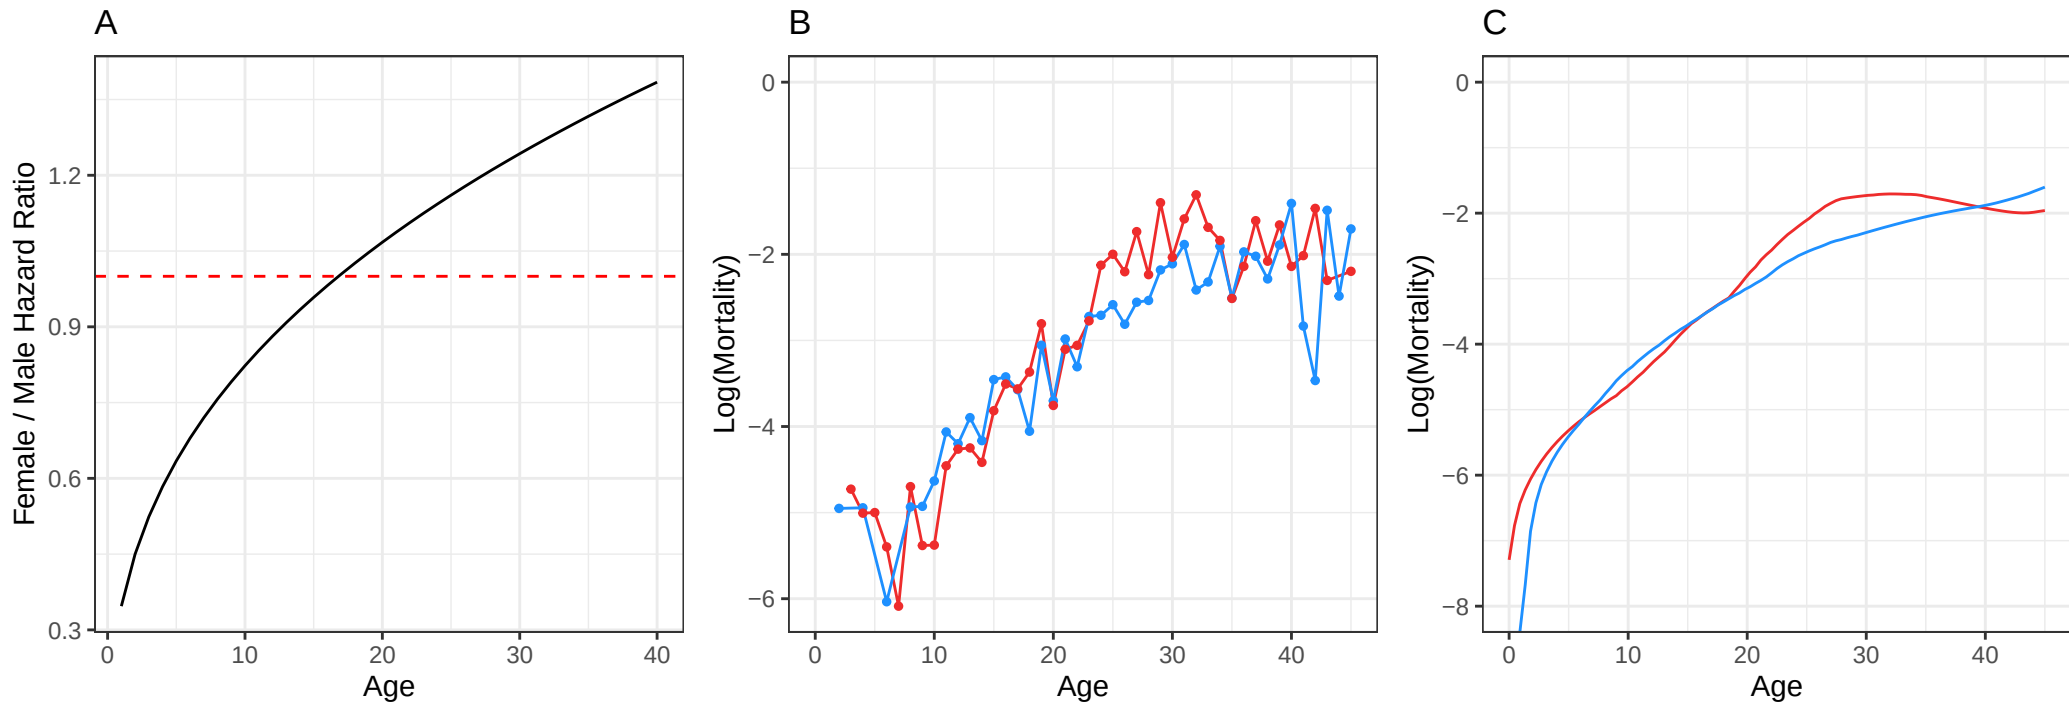

Figure 4. Sex-specific changes in age-specific mortality and hazard rates are age-dependent. Panel A depicts the change in the ratio of male/female hazard over age, assuming an ‘average’-sized butterfly, so only the effect of sex is shown. Panel B shows the manually calculated mortality, separated via sex. Panel C displays the smoothed mortality, created via the muhaz package. Both Panel B and Panel C have log(mortality) as the y-axis, for ease in visualization of the plots.
